Publication Analysis Services in Libraries: What, Why, and How

Ya-Ling Lu and Chris Belter
Informationists, NIH Library
November 1, 2016

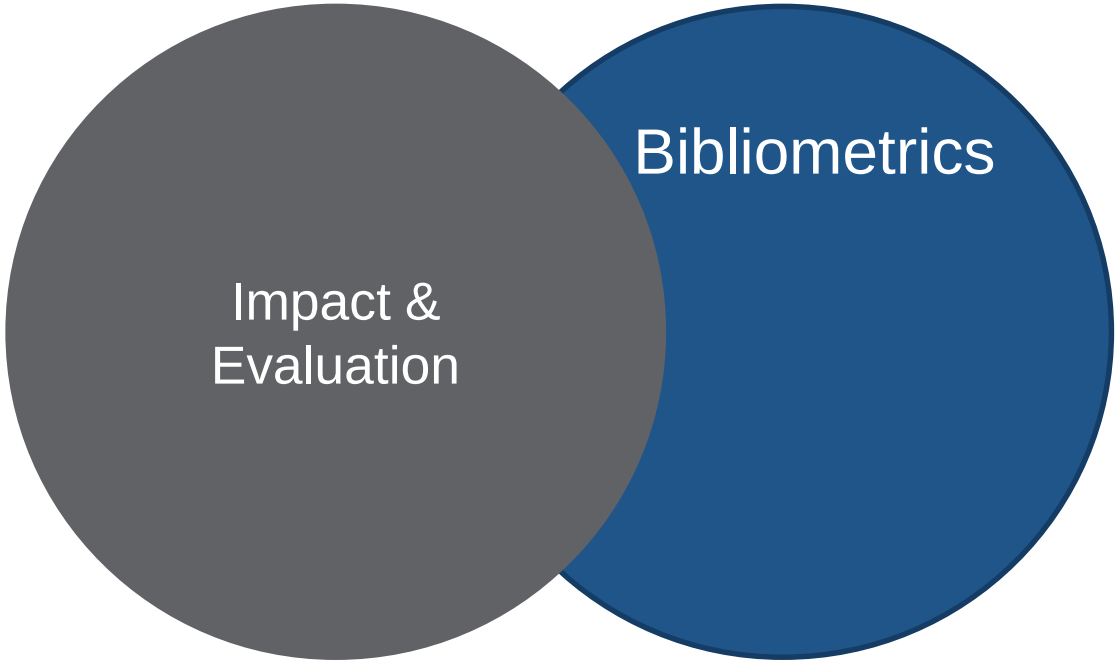
Agenda

- What are Bibliometrics? Key concepts
- Why Bibliometric services? Applications and uses
- Benchmarking individuals and research groups: Citation impact metrics
  - Getting data in and out of Web of Science
  - Basic bibliometric features in Web of Science
  - Basic bibliometric features in InCites and Essential Science Indicators
  - Citation percentiles: Why and how
  - Exercise

- Lunch Break

- Visualizing collaboration and research topics
  - Getting the right data format
  - Basic features of the Science of Science Tool (Sci2)
  - Co-author network analysis
  - Basic features of Gephi
  - Research topic analysis
    - Word co-occurrence analysis
    - Bibliographic coupling
  - Exercise
- Questions and next steps for learning more

What are bibliometrics?



Bibliometrics are quantitative methods of studying scientific research using publications as a proxy for research

Bibliometrics are

A set of tools

A statistical approach

Analysis of structure, dynamics, patterns.

Rationale for policies & design

It has applications in

- History of science
- Sociology of science
- Library science (collection, weeding, policies)
- Information organization & management; IR
- Science policy; resource allocation

Why librarians?

We are part of its history.

We have skills in IS, IR, and KM.

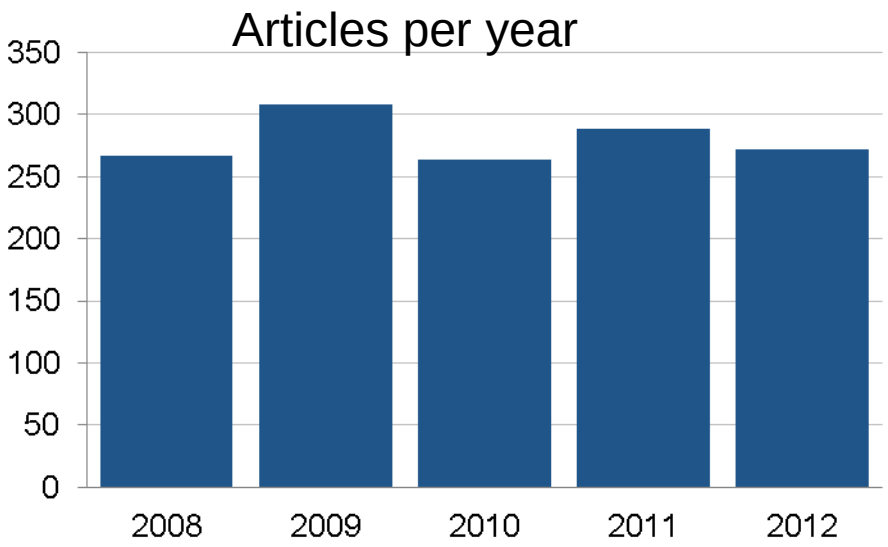
We have provided annotated bibliographies and topic summaries for decades.

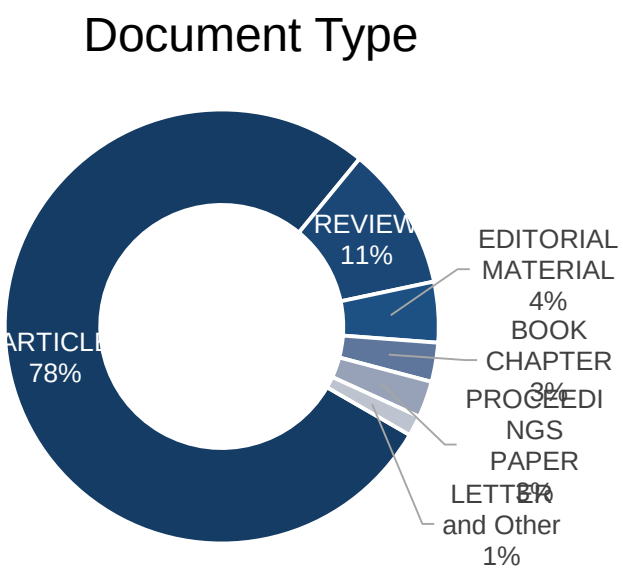
We are trusted to provide accurate and unbiased information.

We provide customized information services.

What can bibliometric analyses do?

Productivity

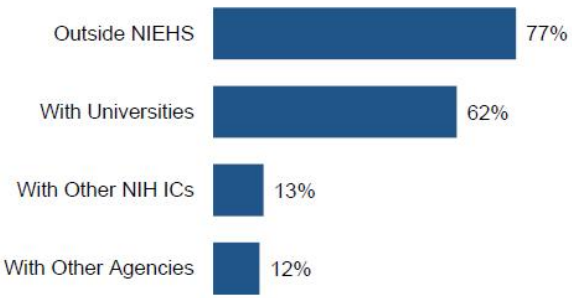




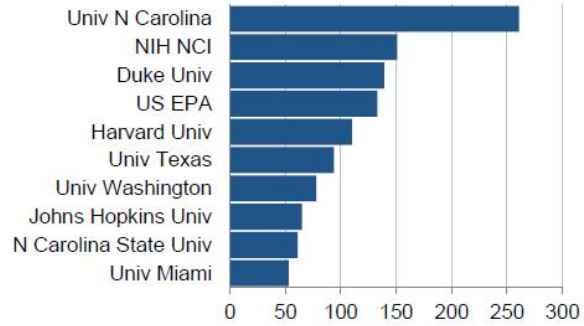
Collaboration: Institutional

Collaboration

Estimated Co-Authorship Rates[4]



Institutional Co-Authored Papers[5]



Institutional Co-Authorship Network[6]

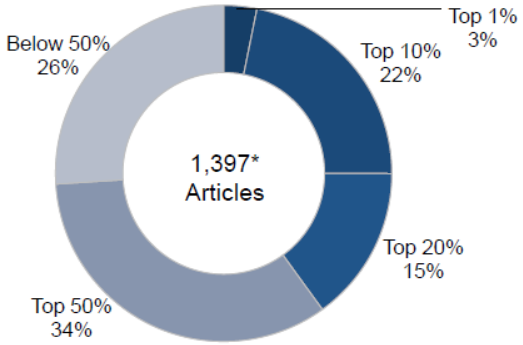
Citation impact

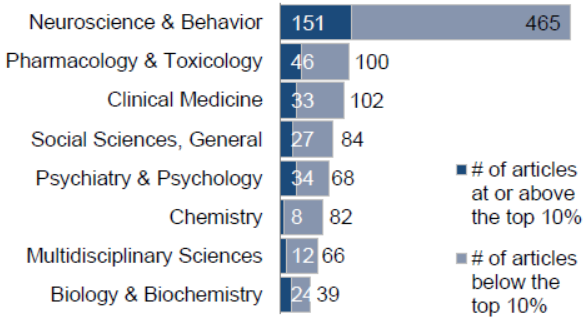
Citation Impact: Entire Institute

Bibliometric Indicator[11]	Value
Number of articles	1,399
Number of citations	29,517
Mean citation count	21.09
Median citation count	12
H-Index	72
# of articles in the top 10% for citations	341
% of articles in the top10% for citations	25%

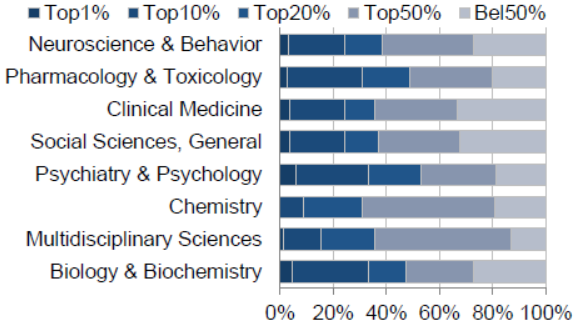
% of Articles per Citation Percentile Rank[12]



Distribution of Articles per ESI Subject Category[13]



% Distribution of Articles per ESI Subject Category[14]



*Note: two articles could not be accurately assigned to percentile ranks, so we excluded them from these analyses.

October 2014

DEMO: How?

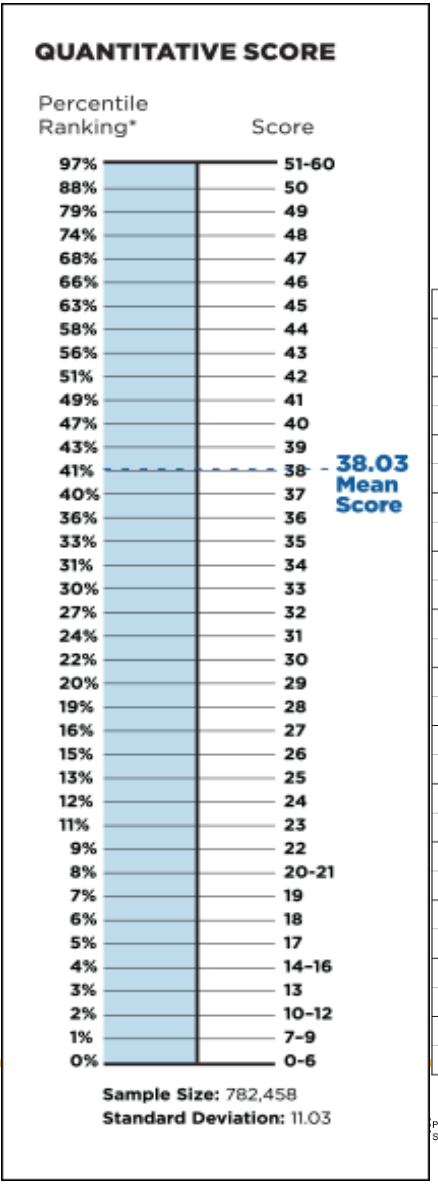
Getting data in and out of WOS

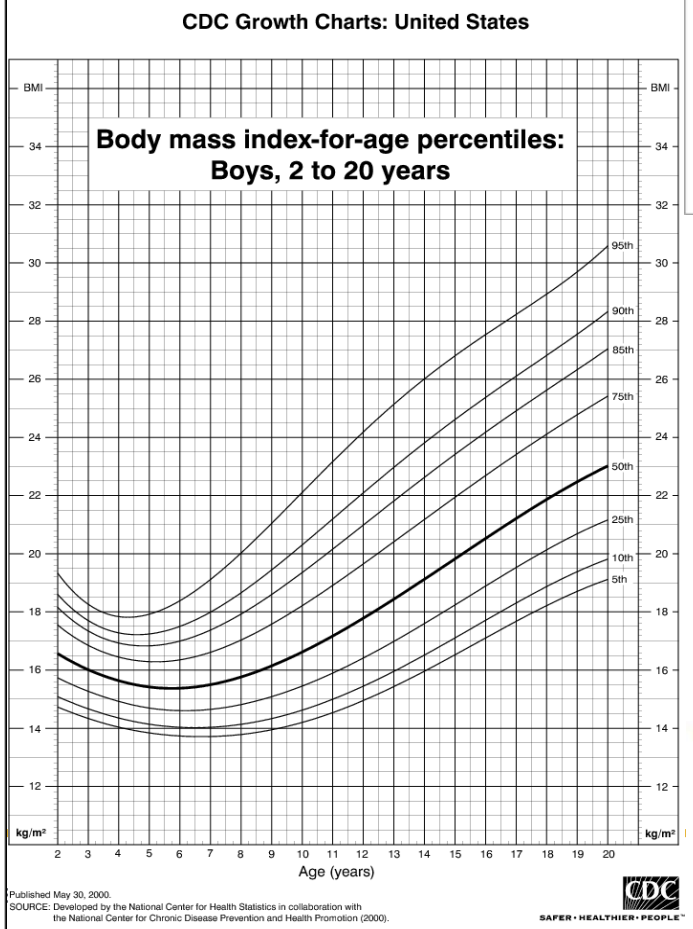
National Institutes of Health
Office of Management

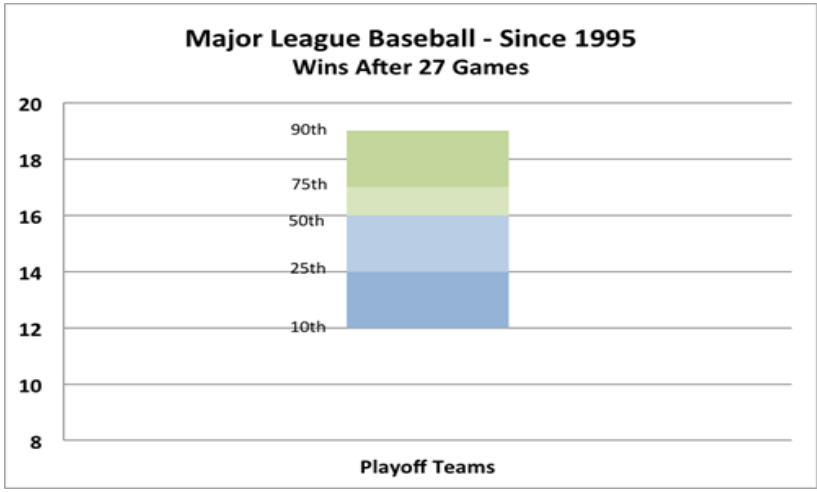
Citation Impact: Percentile ranking using InCites and ESI

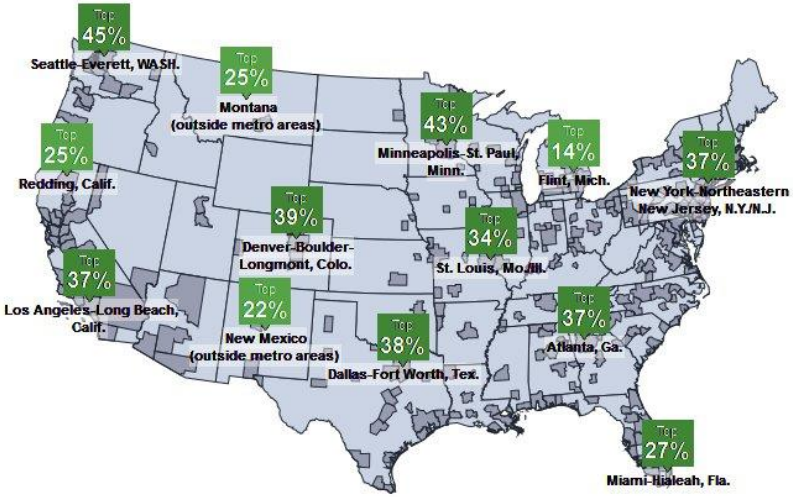
Percentiles

NIH Library
Office of Research Services







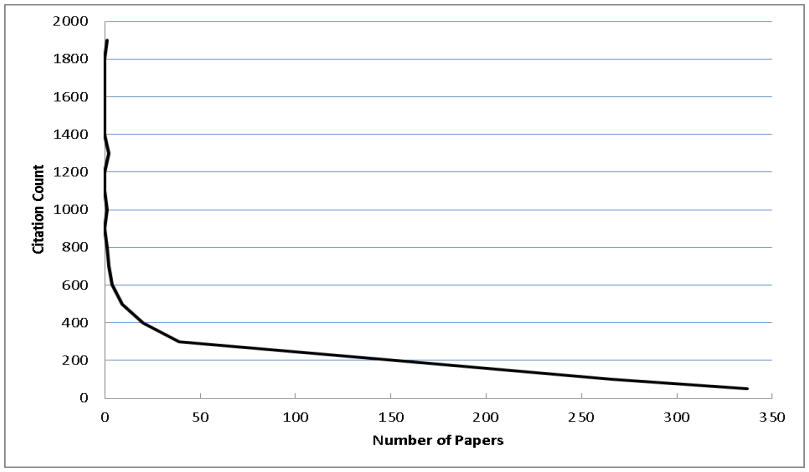


Why percentiles?

- Easy to interpret/compare:
  - You know where you are (paper 5 times better than average papers in field A vs. Top 10% paper in field A)
  - Theoretically, an average institution/author should have 10% of the papers in the top 10% for citation.
  - We can also use the top 10% value as an indicator of excellence paper. The more top 10% papers, the better the research in terms of citation impact.

- Percentiles are not strongly influenced by extremes

Citation distribution is not a normal distribution



- Percentiles can normalize citation impact of publications: based on subject category and publication year

Challenges

- Calculation
  - Equal citations?
    - Use the average rank
    - Use the same rank
  - 0 citation?
  - Articles that have multiple subject categories?
    - “Why do I have to know citation percentiles?” NIHL Journal, 2012.
    - Subject category: A, B, C, D
- Database limitation
- Time consuming!

How to do it (manually)?

A1 to A10	99 percentile	Top 1%
A11 to A20	98 percentile	Top 2%
A21 to A30	97 percentile	Top 3%
.	.	.
.	.	.
.	.	.
.	.	Below 50%
.	.	Below 90%
A981 to A990	2 percentile	.
A991 to A1000	1 percentile	.

Percentile Ranking	Citation Threshold	Where is your paper?
Top 1%	204	
Top 10%	52	?
Top 20%	32	
Top 50%	14

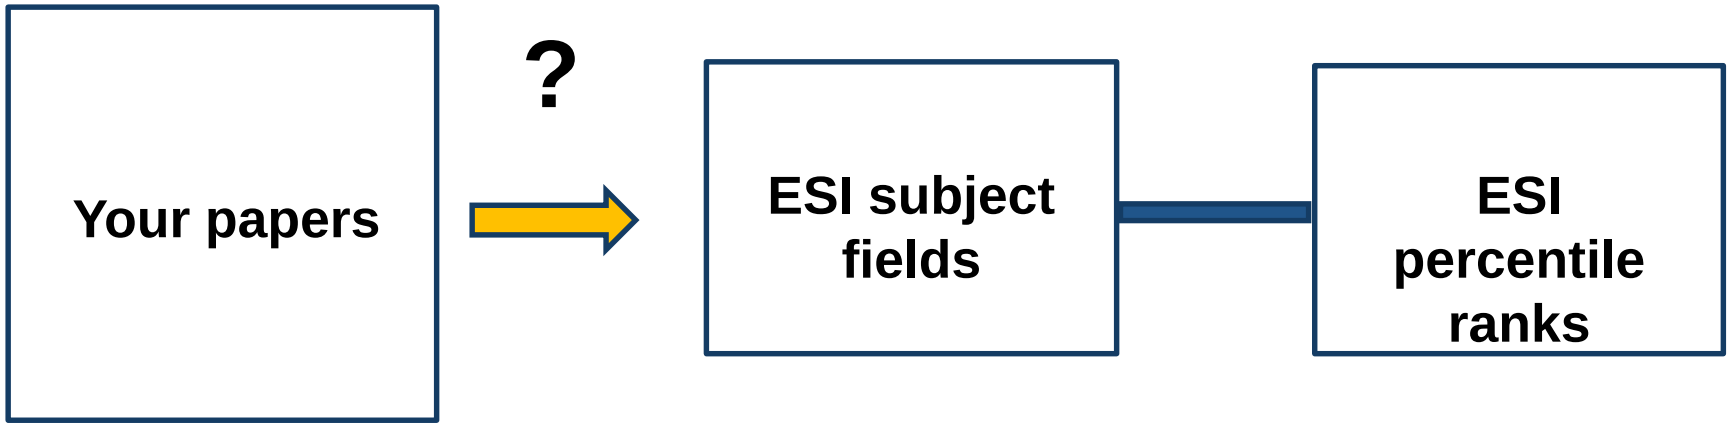
CLINICAL MEDICINE										

ESI limitations

- 11 year period (2006 to 2016)
- ESI has 22 broad research subject areas/fields
- ESI assigns journals to the subject areas/fields
- Most book series and conference proceedings are not indexed by ESI

Workflow



- ESI is based on WOS citations information.
- Unfortunately, ESI subject fields are not included in the WOS metadata.
- Fortunately, ESI has a (secret) journal list that shows the ESI subject fields classification.

It's a matter of matching…

- Copy and paste the ESI journal list to a different sheet, for instance, Sheet 2.

Step 3: VLOOKUP

- VLOOKUP(cell,range,return value,FALSE)
  - Cell: what to look up? (the cells of your journal titles)
  - Range: where to look up? (the ESI journal list)
  - Return value: what to return if there is a match? (Return the subject field)
  - FALSE: exact match (I want exactly the same journal titles.)

=VLOOKUP(J2,Sheet2!$A$2:$F$11428,6,FALSE)

VLOOKUP

- Sheet 1: publication metadata
- Sheet 2: ESI journal list
- Insert one blank column, anywhere in Sheet 1, for instance, Column B
- In Cell B2, type the following

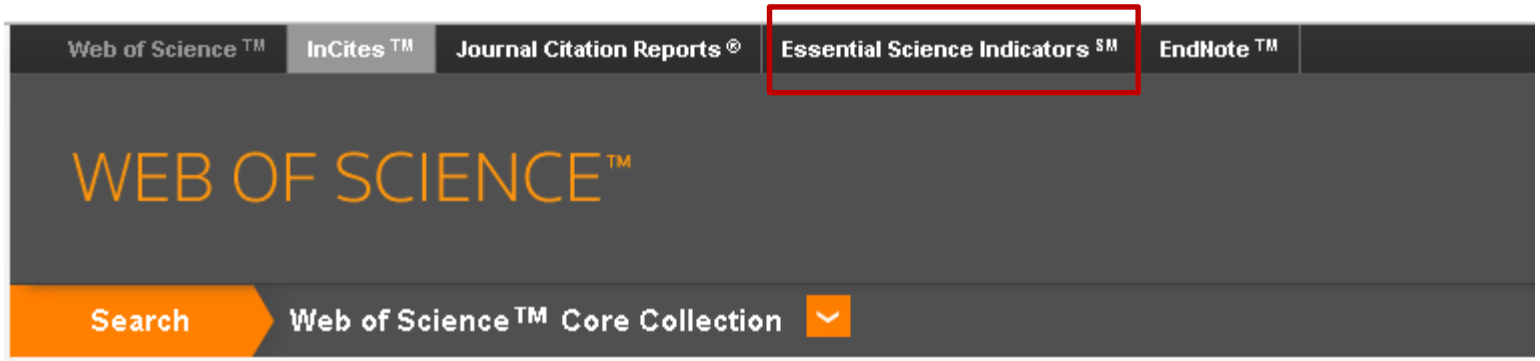
=VLOOKUP(J2,Sheet2!$A$2:$F$11428,6,FALSE)

- Hit “Enter” and you will get either a subject or #N/A
- Check #N/A items for spelling (and, &, space, etc.)
- Check journal merge or update

Your papers → ESI subject fields → ESI percentile ranks

Final step—Find the percentile ranks in ESI

Step 4: Finding the percentile



- ESI➔ Field Baselines➔ Percentiles

ESI percentile table

Citation Rates

Percentiles

Field Rankings

About networks

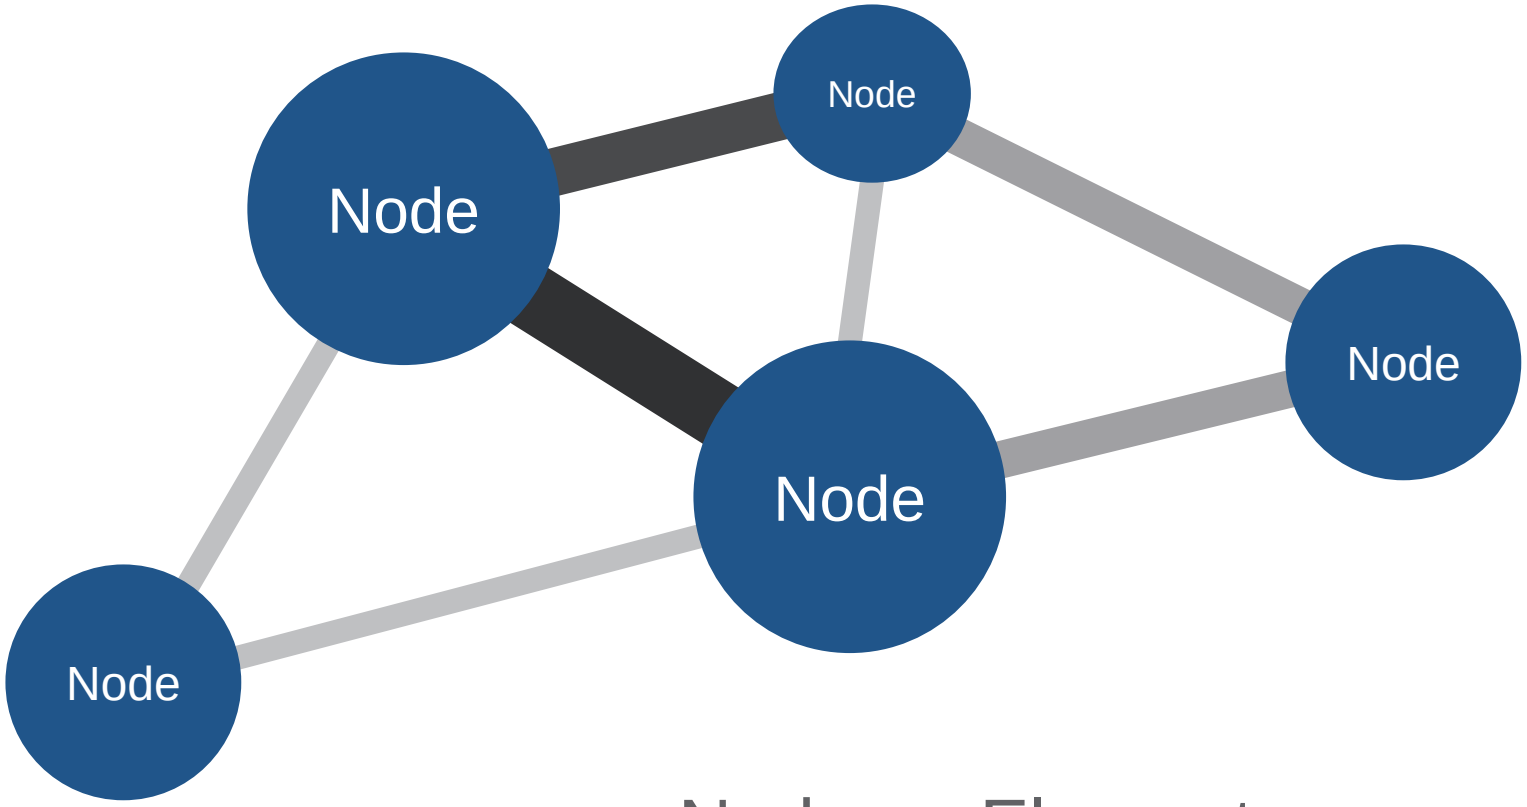
Definition

A network is a set of relationships between things

Parts of a Network

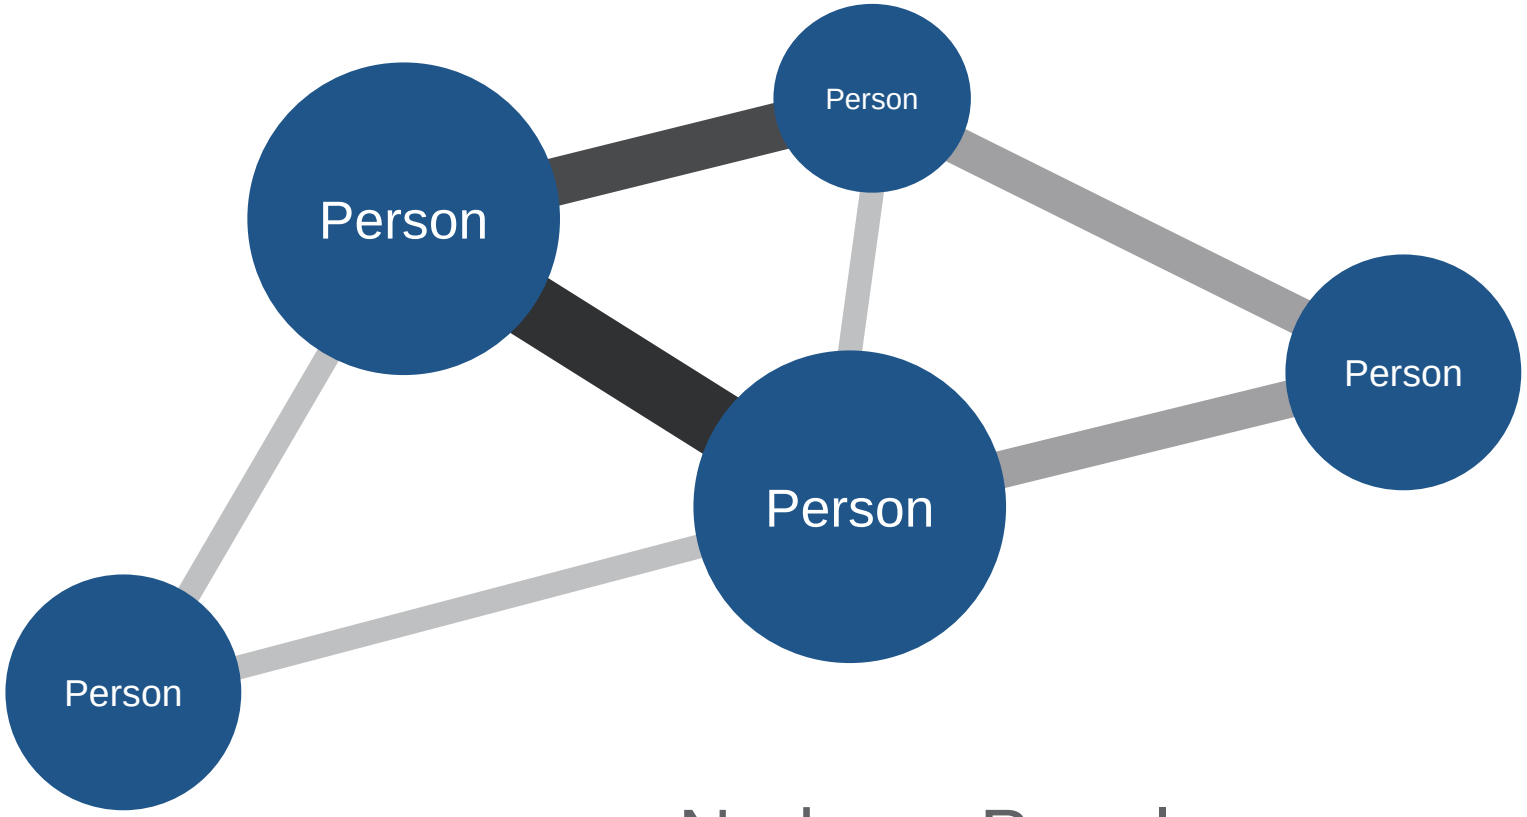
- Nodes
  - Elements of the network
  - Can have attributes
- Edges
  - Connections between nodes
  - Can be directed or undirected
  - Can be weighted or unweighted

Basic network



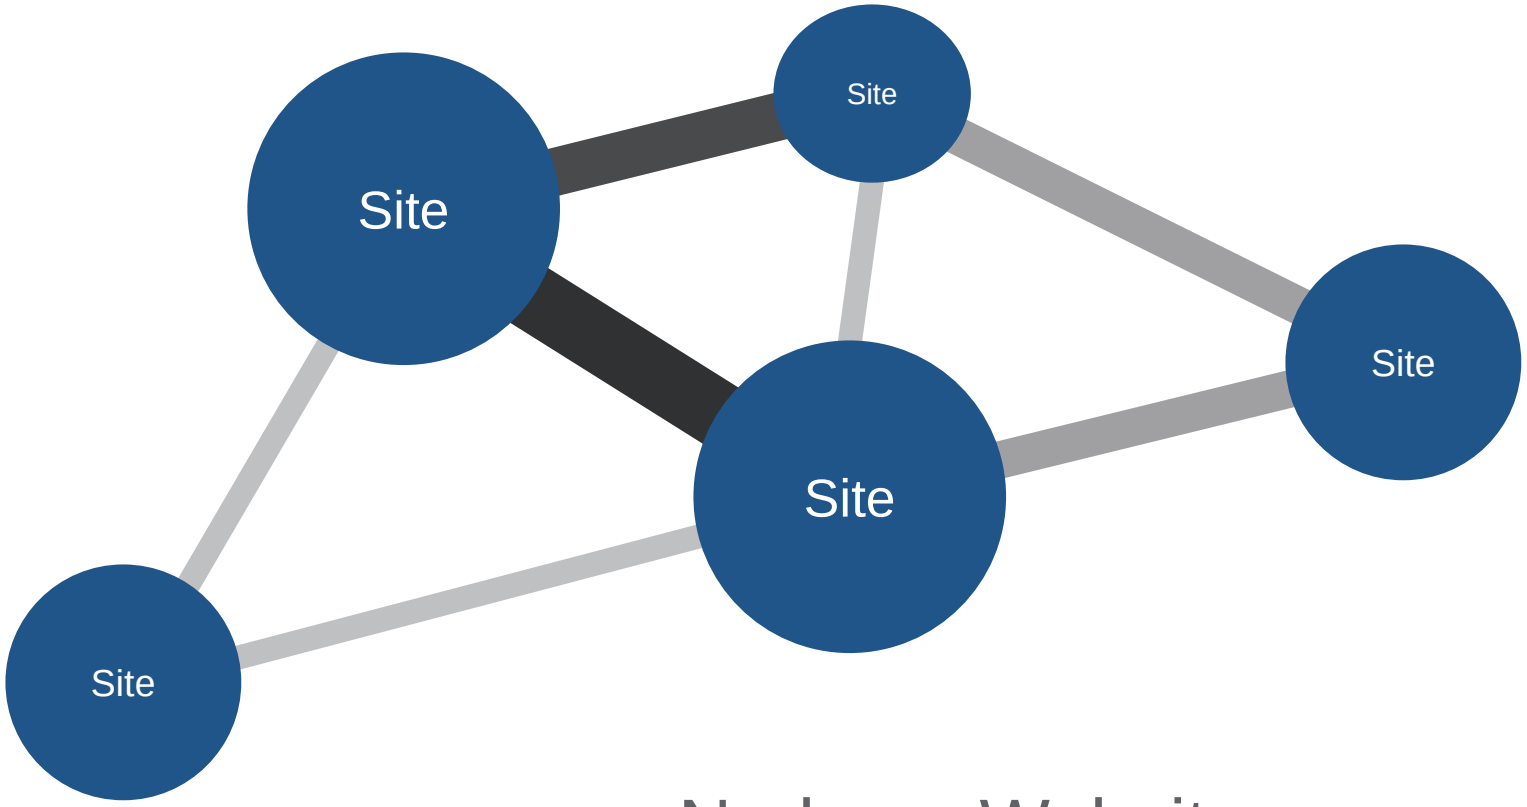
Nodes = Elements
Edges = Relationships

Social network



Nodes = People
Edges = Friendships

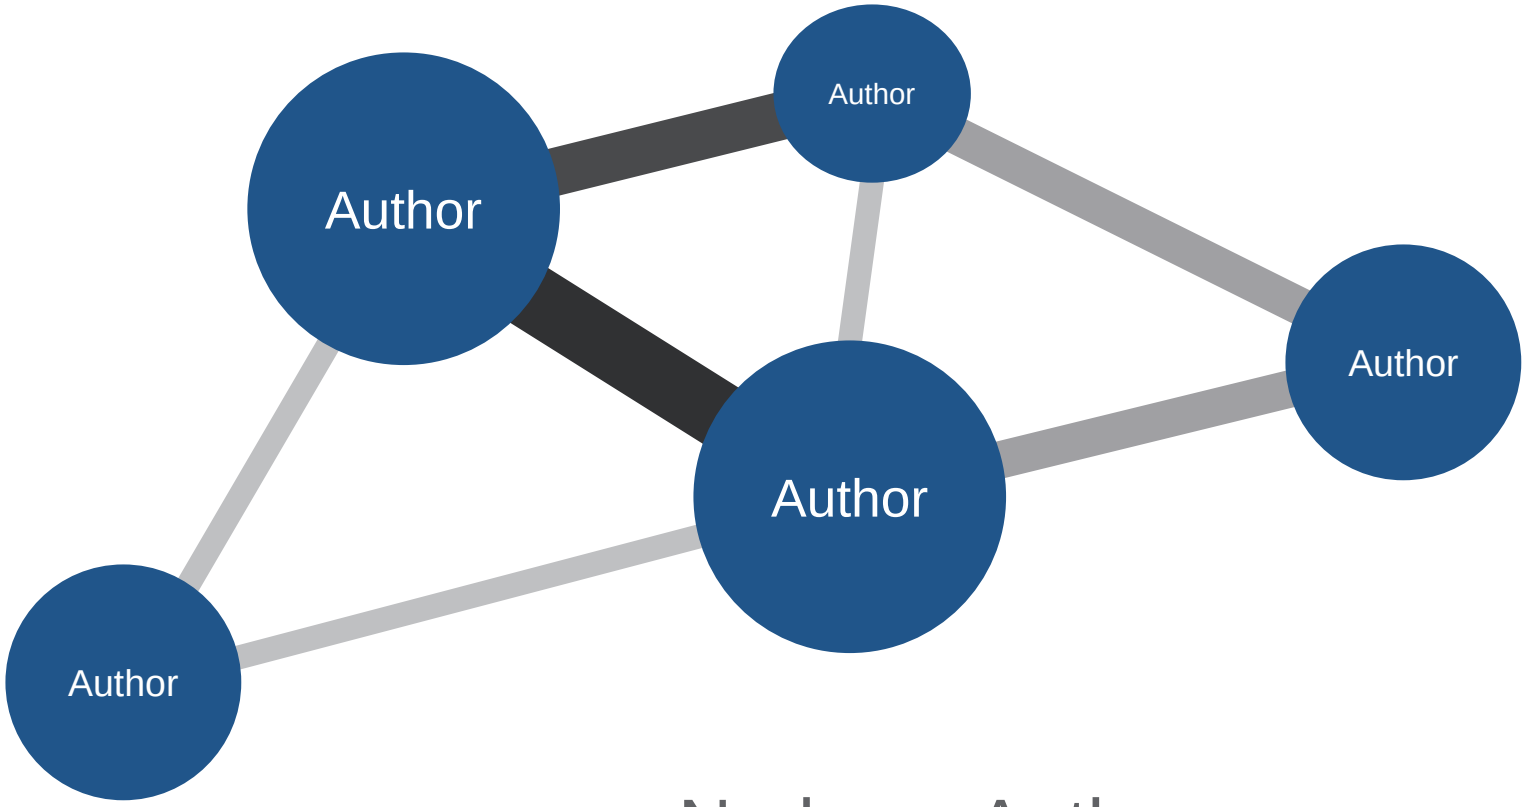
Website network



Nodes = Websites
Edges = Hyperlinks

Co-author networks

Co-author network



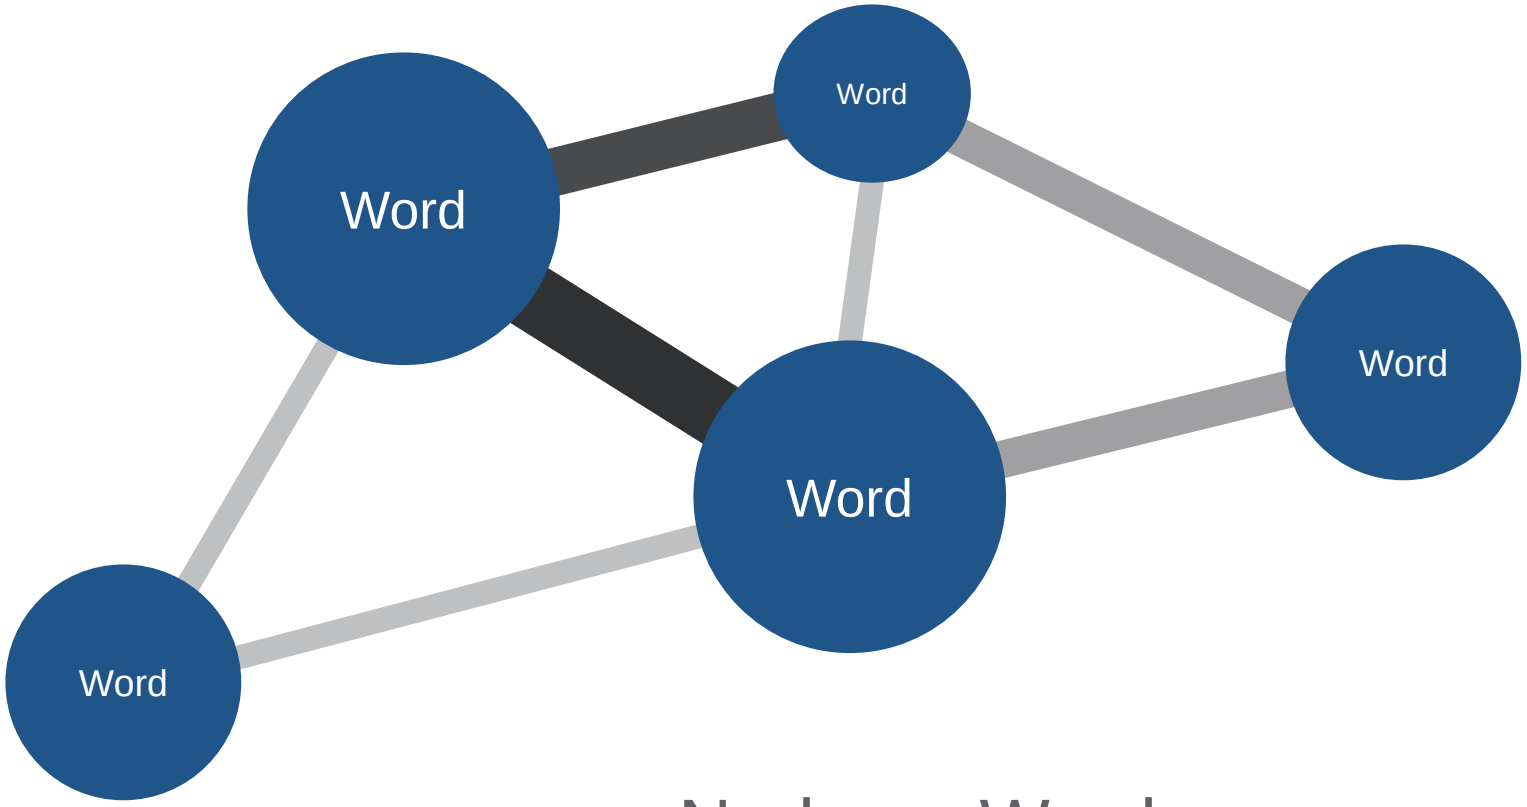
Nodes = Authors
Edges = Co-authorships

Creating them

1. Clean data
2. Load data
3. Create the network
4. Prune the network
5. Visualize

Word co-occurrence networks

Word co-occurrence network



Nodes = Words
Edges = Co-occurrences

Pros and Cons

Pros

- Easy to make
- Easy to understand
- Broadly accurate

Cons

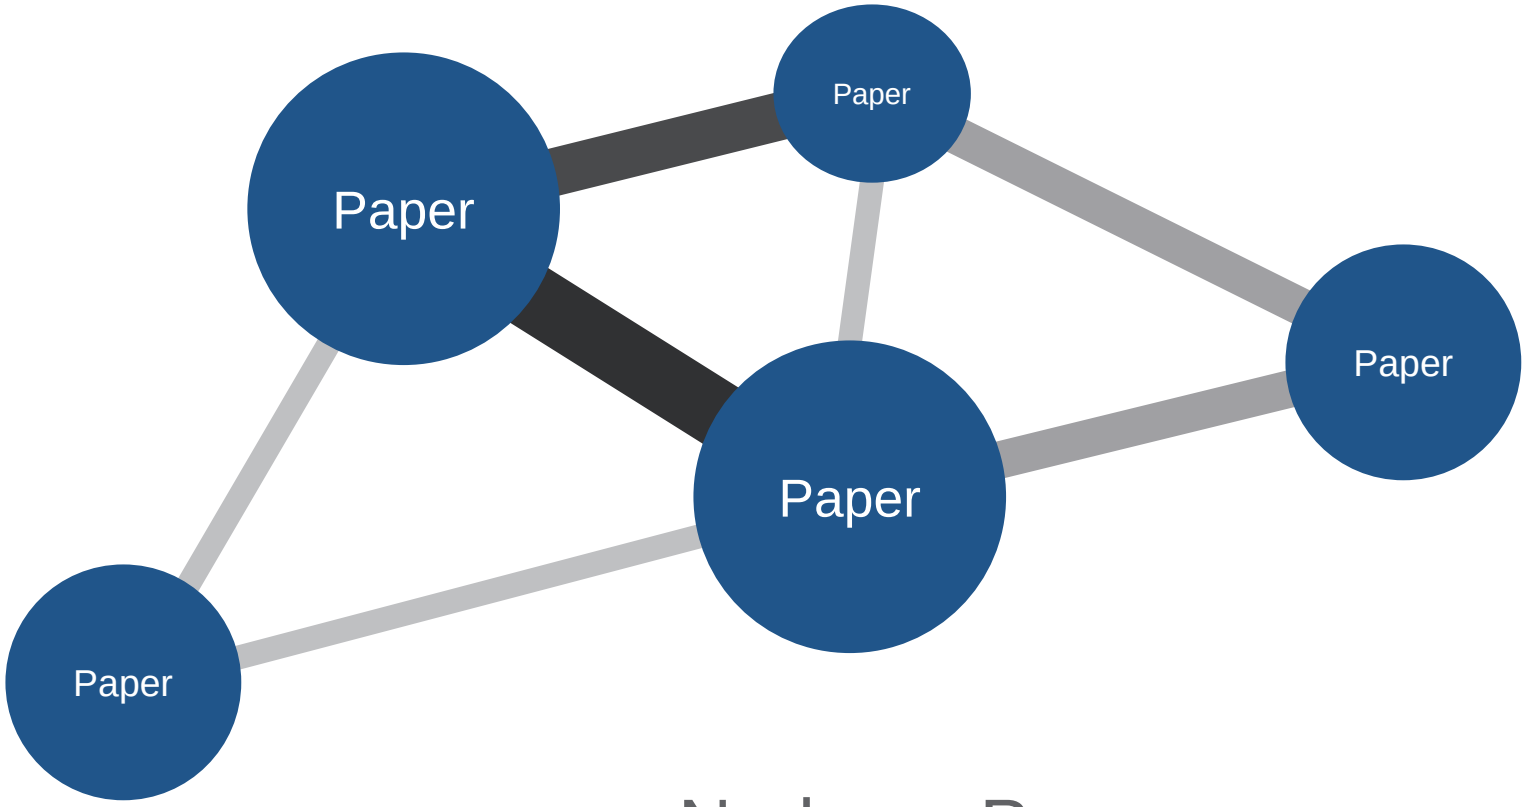
- Synonyms and homonyms
- Very dense
- Low granularity

Creating them

1. Load data
2. Transform word data
3. Create the network
4. Prune the network
5. Visualize

Bibliographic coupling networks

Bibliographic coupling network



Nodes = Papers
Edges = Shared references

Pros and Cons

Pros	Cons
• Higher granularity	• More difficult to create
• Paper-topic assignments	• More difficult to understand
• Self-organization	• Paper loss

Creating them

1. Load data
2. Create paper citation network
3. Create bibliographic coupling network
4. Prune network, if necessary
5. Visualize
